

Google Ads API — Tool Design Document

Markevo Ads Performance Dashboard | Manager account (MCC) 823-141-3591 | <https://markevo.com.br>

1. Overview and purpose

Markevo is a digital marketing / SEM agency. We built an internal web dashboard that consolidates advertising performance from Google Ads and Meta Ads into a single, read-only reporting view for the agency team and for each managed client. The tool **only reads reporting metrics** — it never creates, edits, pauses or mutates any campaign, budget, or entity.

2. Who uses the tool

- Internal: Markevo's traffic/account managers.
- External: each client logs in and sees **ONLY** their own accounts (multi-tenant isolation by account ID + per-client authentication). Clients cannot see other clients' data.

3. How the Google Ads API is used

- Authentication: OAuth2 with a single refresh token belonging to our manager account (MCC 823-141-3591), developer token from the same MCC.
- Calls: `GoogleAdsService.SearchStream` (reporting/GAQL) only — read-only.
- Resources queried: `customer_client` (to discover client accounts under the MCC), `campaign`, `keyword_view`, `geographic_view`, `user_location_view` and `geo_target_constant`.
- Metrics read: impressions, clicks, cost, conversions, conversion value, and clicks by region/city; plus search keywords.
- We do NOT use mutate operations, and we do NOT use App Conversion Tracking or the Remarketing API.

4. Architecture and data flow

- A Python (Flask) web app hosted on the agency's own server (cPanel) at <https://dashboard.markevo.com.br> over HTTPS.
- A scheduled daily refresh (08:00 America/Sao_Paulo) calls the Google Ads API (and the Meta Marketing API), aggregates the metrics in memory (pandas) and serves them to authenticated users.
- Data is kept in an in-memory cache refreshed daily; it is shown only to the owner of the account and is never resold or shared with third parties. No end-user personal data is collected or stored.

5. Expected API call volume

Roughly 25–30 client accounts under the MCC. Each daily refresh performs a few reporting queries per account — on the order of 100–150 operations total — run 1 to 3 times per day. This is comfortably within Basic Access limits.

6. Why we are requesting Basic Access

Our current Analytics access level has a low daily operation quota that is exhausted by the daily multi-account reporting refresh. Basic Access (15,000 operations/day) provides the headroom needed for reliable daily reporting across all managed accounts. We will keep our API contact email current and comply with all Google Ads API policies.
